

WHAT IS CLAIMED IS;

1 1. A seat position detection unit equipped with a slide
2 mechanism that allows a seat to slide with respect to a floor,
3 5 the seat position detection unit comprising:

4 a position sensor attached to one of a stationary member
5 and a movable member that constitute the slide mechanism;

6 a detecting object, which is detected by the position
7 sensor, and which is disposed at the other of the stationary
8 10 member and the movable member; and

9 an mounting member, which mounts the stationary member to
10 the floor, wherein

11 one of the position sensor and the detecting object that
12 is attached to the stationary member is united with the mounting
13 15 member.

1 2. A seat position detection unit according to claim 1, wherein

2 the position sensor is attached to one of the stationary
3 member and the movable member through a connection member,
4 20 wherein

5 the connection member has a protector which protects the
6 position sensor.

1 3. A seat position detection unit according to claim 1, wherein

2 25 the position sensor is attached to the movable member
3 through a connection member, which has a protector that

protects the position sensor, and wherein
the detecting object is connected to the stationary member
through the attaching member, and wherein
the surface of the connection member, the attaching member,
and the detecting object are covered with a resin.

4. A seat position detection unit comprising:

a movable member, which is attached to a bottom of a seat
so that the movable member is located along the fore-and-rear
directions with respect to the seat;

a stationary member, which is put together with the
movable member and allows the seat to slide along the stationary
member;

a mounting member, which mounts the stationary member to
a floor;

a position sensor, which is attached to the movable
member; and

a detecting object, which is detected by the position
sensor, and is disposed at the stationary member,

wherein the detecting object and the mounting member are
provided as a single piece.

5. A seat position detection unit according to claim 4, wherein

the position sensor is attached to the movable member
through a connection member, and wherein

the connection member has a protector, which protects the

5 position sensor.

1 6. A seat position detection unit according to claim 5, wherein
2 the stationary member is provided along the fore-and-rear
3 5 directions of the seat, and wherein
4 the mounting member includes
5 a first mounting member that mounts the stationary
6 member to the floor at the fore-side end of the stationary
7 member, and
8 10 a second mounting member that mounts the stationary
9 member to the floor at the rear-side end of the stationary
10 member, and wherein
11 the first mounting member and the detecting object are
12 provided as a single piece.

15

1 7. A seat position detection unit according to claim 6, wherein
2 the surface of the mounting member and the connection
3 member are covered with a resin.
